

CLIMATE CHANGE POLICY

- ▷ 1. We comply with the applicable regulations and other commitments signed under climate change and greenhouse gas emissions and removals. We also participate in the development of public policies in favor of decarbonization and the increase of carbon removal.
- ▷ 2. We develop sustainable products, from a natural, renewable, recyclable, and biodegradable raw material.
- ▷ 3. We measure and manage our carbon footprint and strive to reduce it, contributing to the goal of achieving a low-carbon economy.
- ▷ 4. We ensure the regeneration capacity and vitality of our forests to improve their role as quality carbon sinks and suppliers of renewable raw materials, generating additional impacts for our stakeholders and biodiversity. Our products store carbon during their lifetime, helping to mitigate climate change. We map our main climate risks and vulnerabilities and seek to mitigate the effects on our operations in the affected parts.
- ▷ 5. We promote the generation of non-conventional renewable energy (NRCS) that allows us to self-supply and contribute to decarbonize local and national energy systems.
- ▷ 6. We seek to invest in additional NRNC generation capacity above the usual industry requirement, considering the provisions of the Kyoto Protocol's Clean Development Mechanism (CDM).
- ▷ 7. We strive to make responsible use of energy and are committed to efficient energy management. We actively participate in research and development, seeking alliances that help combat climate change and alternatives for its adaptation, with an integrated approach to climate risk and opportunities.

All the people who work in ARAUCO are responsible for spreading these concepts and commitments with our collaborators, service companies, customers, suppliers, community, and other parts to promote concrete actions to address the impacts of climate change and having this policy present in our everyday behavior and decisions.
